

BoardOS Project

Master's Degree in Computer Engineering
Cybersecurity

Presented by:

Jacopo Coniglio
Francesca Coriale
Sibilla Merlo
Giulia Lydia Perini
Ankesh Porwal

A.Y. 2023/2024

**Politecnico
di Torino**

The project required the usage of a STM32 Nucleo-64 Board paired with STM32F446RE microcontroller.

We used FreeRTOS for the implementation of exercises.

Point 1: Installation and usage procedures

Requirements

- Device running Windows OS (7, 8, or 10), Linux 64-bit, or macOS
- USB Type-A to Mini-B cable to connect the board to the device

Point 1: Installation and usage procedures

Initial steps

- Users must register on the official ST website at www.st.com
- Download STM32CubeIDE-xxx
- Connect the board to the device
- Launch the application

	Part Number ▲	General Description	Latest version	Download	All versions

Point 1: Installation and usage procedures

Creating a project

- Define a workspace
- Select the specific MCU or MPU or choose the board

The screenshot shows the STM32CubeMX Board Selector interface. The top navigation bar includes tabs for MCU/MPU Selector, Board Selector (active), Example Selector, and Cross Selector. The left sidebar contains filters for Board Filters, Product Info, and Memory. The main area displays the STM32F4 Series, specifically the NUCLEO-F446RE board. It includes a large image of the board, a description, and a table of specifications.

NUCLEO-F446RE

STM32 Nucleo-64 development board with STM32F446RE MCU, supports Arduino and ST morpho connectivity

ACTIVE
Product is in mass production

Part Number : NUCLEO-F446RE
Commercial Part Number : NUCLEO-F446RE

Unit Price (US\$) : 14.0
Mounted Device : STM32F446RET6

The STM32 Nucleo-64 board provides an affordable and flexible way for users to try out new concepts and build prototypes by choosing from the various combinations of performance and power consumption features, provided by the STM32 microcontroller. For the compatible boards, the

Point 2: Examples illustrating the functionalities of the board

- ▶ Point 1: Installation and usage procedures
- ▶ **Point 2: Examples illustrating the functionalities of the board**
- ▶ Point 3: Customization of the operating system
- ▶ Point 4: Benchmarks of the results obtained in point 3

Point 2: Examples

Example 0: Basic Scheduling

- **Aim:** explanation of how scheduling works in FreeRTOS
- Three tasks: High, Medium and Low priority
- After *osKernelStart()* operation the scheduler starts

```
/* Definitions for Task1 */  
osThreadId_t Task1Handle;  
const osThreadAttr_t Task1_attributes = {  
    .name = "Task1",  
    .stack_size = 128 * 4,  
    .priority = (osPriority_t) osPriorityHigh,  
};
```

Point 2: Examples

Example 0: Basic Scheduling

- Each task has an infinite loop that makes it to execute 3 times
- Then terminate
- First task chosen is High task, then Medium and then Low

```
void StartTask1(void *argument)
{
    /* USER CODE BEGIN 5 */
    /* Infinite loop */
    for(;;)
    {
        int c;
        c = Task1_Profiler++;
        printf("Task-1 %d \n", c);
        if (c >= 3) {
            osThreadExit();
        }
    }
    /* USER CODE END 5 */
}
```

Point 2: Examples

Example 1: LCD1602

- **Aim:** initialization and use of an LCD1602 screen to **display a message** "Time left" and a countdown from 600 to 1
- Writes the string "Time left" to the LCD1602 display at position (0,3)
- The **HAL_Delay** function creates a time interval between iterations of the for loop, thus producing a visual countdown effect on the display

```
Lcd_cursor(&lcd, 0,3);  
Lcd_string(&lcd, "Time left");  
for ( int x = 600; x >= 1 ; x-- )  
{  
    Lcd_cursor(&lcd, 1,7);  
    Lcd_int(&lcd, x);  
    HAL_Delay (1000);  
}
```

Point 2: Examples

Example 1: LCD1602

```
lcd = Lcd_create(ports, pins, GPIOB, GPIO_PIN_5, GPIOB, GPIO_PIN_4, LCD_4_BIT_MODE);
```

- **ports**: an array of GPIO port configurations. This array specifies the GPIO ports used for communication with the LCD: **GPIOC, GPIOB, GPIOA** are being passed.
- **pins**: an array of GPIO pin configurations. This array specifies the specific pins within the GPIO ports used for communication with the LCD: **GPIO_PIN_7, GPIO_PIN_6** are being passed.
- **lcd_4_bit_mode**: indicates that the LCD is configured to use a **4-bit data** bus mode, a common configuration for interfacing with LCDs.
- **gpio_pin_4**: this is used for the EN function.

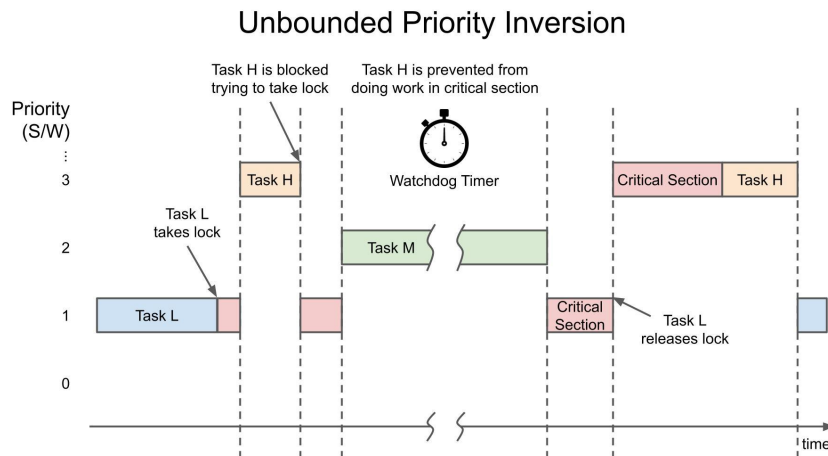

Point 2: Examples

Example 3: Priority inversion

- **Aim:** develop an example with the priority inversion bug and then fix it
- Three task with different priorities: High, Medium, Low

- High task binary semaphore
- Low semaphore binary semaphore but button to release it
- Medium task linear execution

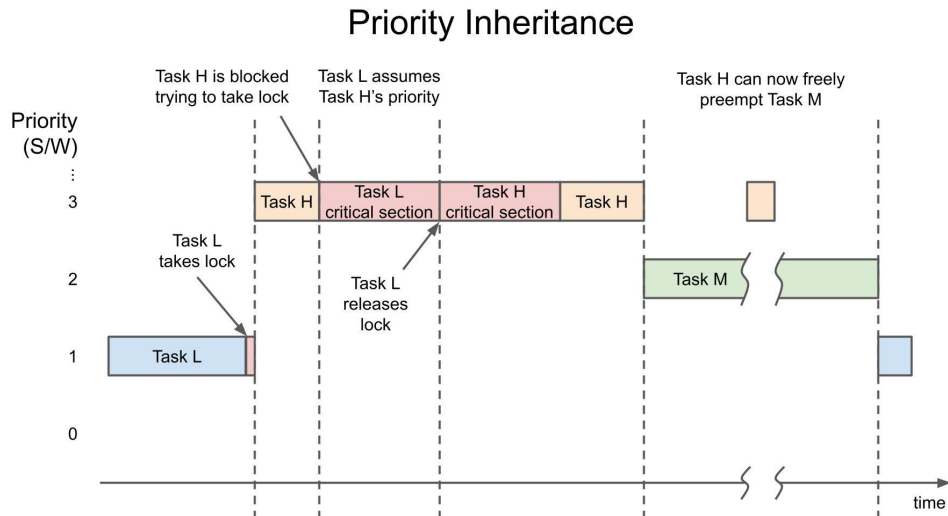

Point 2: Examples

Example 3: Priority inversion

- mutexes in FreeRTOS implement priority inheritance
- priority of low task temporarily raised

Point 2: Examples

Example 2: Led with interrupt

- **Aim:** update the status of the green LED using the Blue Button

- counter = 0, then it blinks with a period of 0.5 seconds;
- counter = 1, then it remains lit;
- counter = 2, then it remains off;
- counter = 3, we start again the cycle by setting the counter = 0

```
for(;;)
{
    /* Blue button not pressed: */
    if(counter == 0){
        HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_SET);
        osDelay(500);
        HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_RESET);
        osDelay(500);
    }
    /* Blue button pressed 1 time: */
    else if(counter == 1){
        HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_SET);
    }
    /* Blue button pressed 2 times: */
    else if(counter == 2){
        HAL_GPIO_WritePin(GPIOA, GPIO_PIN_5, GPIO_PIN_RESET);
    }
    else{
        counter = 0;
    }
}
```

Point 2: Examples

Example 2: Led with interrupt

```
/* EXTI interrupt init*/  
HAL_NVIC_SetPriority(EXTI15_10_IRQn, 5, 0);  
HAL_NVIC_EnableIRQ(EXTI15_10_IRQn);
```

- Callback function to update the counter when the interrupt occurs

```
/* Function to handle the interrupt */  
void HAL_GPIO_EXTI_Callback(uint16_t GPIO_Pin) {  
    if(GPIO_Pin == GPIO_PIN_13) {  
        counter++;  
    }  
}
```

Point 3: Customization of the operating system

- ▶ Point 1: Installation and usage procedures
- ▶ Point 2: Examples illustrating the functionalities of the board
- ▶ **Point 3: Customization of the operating system**
- ▶ Point 4: Benchmarks of the results obtained in point 3

Point 3: Customization

Customization of the operating system

- Task 1 with priority = 3, an execution time of 2s and then stopped for 4s;
- Task 2 with priority = 2, an execution time of 1s and then stopped for 2s;
- Task 3 with priority = 1, an execution time of 0.5s and then stopped for 0.5s;

Point 3: Customization

Customization of the operating system

```
TickType_t xCurrentTime = xTaskGetTickCount(); //current time
TCB_t *pxTCB;

//Initial control: two tasks in the block list
if (listCURRENT_LIST_LENGTH(pxDelayedTaskList) >= 2)
{
    //get the first element of the list
    ( pxTCB ) = listGET_OWNER_OF_HEAD_ENTRY(pxDelayedTaskList);

    //get the remaining ticks of the delay time of the first element of the block list
    xNextTaskUnblockTime = listGET_LIST_ITEM_VALUE( &(amp; ( pxTCB )->xStateListItem ) );

    TickType_t xCurrentTaskUnblockTime = xCurrentTime + xTicksToDelay;
    //compare the delay ticks of the current task with the delay ticks of the first element
    if(xCurrentTaskUnblockTime <= xNextTaskUnblockTime)
        return;
}
```

Point 4: Benchmarks of the results obtained in point 3

- ▶ Point 1: Installation and usage procedures
- ▶ Point 2: Examples illustrating the functionalities of the board
- ▶ Point 3: Customization of the operating system
- ▶ **Point 4: Benchmarks of the results obtained in point 3**

Point 4: Benchmarks

Benchmarks of the implementation

- define the function *convertTicksToTime()*

```
/* function to convert tick in time */  
void convertTicksToTime(TickType_t ticks, unsigned int *seconds, unsigned int *milliseconds) {  
    // Calcola il tempo totale in millisecondi  
    uint32_t totalMilliseconds = (ticks * 1000) / TICKS_PER_SECOND;  
  
    // Calcola i secondi e i millisecondi  
    *seconds = totalMilliseconds / 1000;  
    *milliseconds = totalMilliseconds % 1000;  
}
```

- timestamp for every task the tick of beginning and the tick of ending, convert them into seconds and milliseconds and then print them on the screen.

Point 4: Benchmarks

Benchmarks of the implementation

- Final result:

Port 0 X

Start scheduling...

```
Start Task 1... 0 seconds, 0 milliseconds
End Task 1... 2 seconds, 0 milliseconds
Start Task 2... 2 seconds, 0 milliseconds
End Task 2... 3 seconds, 0 milliseconds
Start Task 3... 3 seconds, 0 milliseconds
End Task 3... 3 seconds, 500 milliseconds
Start Task 3... 3 seconds, 500 milliseconds
End Task 3... 4 seconds, 0 milliseconds
Start Task 3... 4 seconds, 0 milliseconds
End Task 3... 4 seconds, 500 milliseconds
Start Task 3... 4 seconds, 500 milliseconds
End Task 3... 5 seconds, 0 milliseconds
Start Task 2... 5 seconds, 0 milliseconds
End Task 2... 6 seconds, 0 milliseconds
Start Task 1... 6 seconds, 0 milliseconds
End Task 1... 8 seconds, 0 milliseconds
Start Task 2... 8 seconds, 0 milliseconds
End Task 2... 9 seconds, 0 milliseconds
Start Task 3... 9 seconds, 0 milliseconds
End Task 3... 9 seconds, 500 milliseconds
Start Task 3... 9 seconds, 500 milliseconds
End Task 3... 10 seconds, 0 milliseconds
Start Task 3... 10 seconds, 0 milliseconds
```

Thanks for your attention!
